

SAILESH P

Interactive Vintage Portfolio + Private Analytics Dashboard

Complete Development Specification

Public portfolio • Portfolio CMS • Visitor analytics • Resume tracking • Contact notifications • Secure dashboard

Design direction	Vintage paper / archival document + modern interaction
Primary navigation	Floating bottom icon dock with hover labels
Public pages	Home, About, Projects, Stack, Experience/Education, Hire Me
Private area	Secure dashboard with analytics and content management
Target	Desktop + mobile + installable PWA dashboard

Version: August 2026

1. Product Overview

The project is a premium personal portfolio that combines a tactile vintage-paper visual identity with modern web animation and a private portfolio-management dashboard. The public site should feel like an interactive personal archive, while the dashboard should behave like a small professional CMS and analytics product.

Main goals

- Present Sailesh P as a UI/UX Designer and Frontend Developer.
- Show real projects, skills, experience, education and contact information.
- Use a distinctive paper/document visual system rather than a generic SaaS portfolio.
- Allow all portfolio content to be edited from the dashboard without changing source code.
- Track anonymous portfolio visits, page views, scroll depth, project interactions, CV downloads and contact submissions.
- Provide useful notifications when a CV is downloaded or a contact form is submitted.
- Make the dashboard responsive and installable as a mobile PWA.

2. Reference Design System

The first visual reference establishes the paper look: warm ivory paper, rough edges, dark ink typography, subtle texture, shadows and imperfect borders. The second reference establishes the interaction model: a dark modern presentation, compact bottom navigation, icon-first controls and strong motion.

Element	Specification
Paper	Warm ivory/parchment, subtle grain, slightly imperfect edges
Typography	Serif/editorial headings + clean sans/mono for metadata
Borders	Thin dark lines, irregular/handmade feel where appropriate
Depth	Soft paper shadows, layered sheets, slight rotations
Animation	Framer Motion/GSAP, 300–700ms page transitions
Navigation	Floating bottom-center icon dock; tooltip/label on hover
Sound	Optional subtle click/paper sounds with a visible sound toggle
Dashboard	Separate clean dark/premium admin UI; do not copy the public paper styling too literally

3. Public Information Architecture

Route	Purpose
/	Home / hero / selected projects / short introduction / CTA
/about	Personal record, introduction, design philosophy
/projects	Work archive and project details
/stack	Skills and technologies with proficiency levels
/experience	Work experience and education
/hire	Contact, availability and hiring CTA

Route	Purpose
CV	Direct resume download action

4. Bottom Navigation

Use the same bottom navigation concept on desktop and mobile. Default state is icon-only. Hovering an icon reveals its name; on mobile, tapping can briefly reveal the label before navigation.

Item	Icon concept	Action
Home	House	Go to /
About	User	Go to /about
Projects	Spark/Folder	Go to /projects
Stack	Layers/Code	Go to /stack
Experience	Briefcase/Timeline	Go to /experience
Hire Me	Arrow/Send	Go to /hire
CV	Download	Download current CV

Use Lucide React or another consistent icon set. Do not use emoji as navigation icons.

5. Home Page Feature Specification

- Hero: name, title, concise positioning statement, View Work CTA and Hire Me CTA.
- Availability indicator such as Available for opportunities.
- Selected Projects: 3–5 strongest projects with cover image, role, year, technology and links.
- Short About section with a link to the full About page.
- Skill preview showing the most important technologies.
- Experience/Education preview.
- Final contact CTA.
- Persistent bottom navigation and optional sound control.
- Responsive layout with touch-friendly interactions and reduced-motion fallback.

6. Projects / Work CMS

Projects must be editable from the dashboard. Each project supports create, edit, delete, reorder, publish/unpublish and featured status.

Field	Purpose
Title	Project name
Slug	SEO-friendly URL
Description	Short project summary
Long case study	Detailed project story
Cover image	Primary visual
Gallery	Additional screenshots/mockups
Role	UI/UX, Frontend, Full project, etc.
Year	Project year
Technologies	Linked skills/tech stack
Live URL	Working project link
GitHub URL	Repository link when applicable
Category	Portfolio classification
Featured	Show on homepage
Published	Public visibility
Display order	Manual ordering

7. Experience / Education CMS

The dashboard must provide Add, Edit, Delete, Reorder and Publish/Hide controls.

Experience fields	Company, role, employment type, start date, end date/present, location, description, tech
Education fields	Institution, degree, field, start year, end year, description, logo, order

8. Skills / Stack CMS

Skills should support an explicit proficiency label plus an internal numeric value. Avoid pretending that a technical skill is objectively measurable to an exact percentage; display the level as Beginner, Intermediate, Advanced or Expert.

Field	Example
Name	Next.js
Category	Development
Level	Advanced
Numeric value	75-85 internal range
Icon	Lucide/custom icon
Years	Optional
Description	Optional
Visible	Yes/No
Order	Manual

9. Private Dashboard

The dashboard is a separate authenticated application area, for example under /dashboard. It should have a professional admin UI and should not expose private analytics to public visitors.

Section	Main features
Overview	Visitors, page views, CV downloads, messages, conversion metrics
Visitors	Unique visitors, sessions, new/returning, device and referrer summaries
Live Visitors	Anonymous active sessions and current page
Page Analytics	Views, unique views, average engagement and scroll depth
Projects	Project CMS
Experience	Experience CMS
Skills	Stack CMS with levels
Education	Education CMS
Resume	Upload/select current CV and download analytics
Messages	Contact form inbox and status
Notifications	Resume download and contact notifications
Settings	Profile, sound, analytics, security and notification settings

10. Dashboard Authentication

The requested login should visually resemble a secure mobile device: logo, 4-digit PIN keypad and biometric/passkey option. The PIN must never be stored as plain text. For biometric/device login, use WebAuthn/passkeys rather than implementing fingerprint scanning directly.

- Primary: secure 4-digit PIN entry backed by a server-side password/PIN hash.
- Fallback: email + password.
- Forgot password: email-based reset flow.
- Passkey/WebAuthn: Windows Hello, fingerprint, face authentication or platform-supported biometric unlock.
- Session security: secure, HttpOnly cookies, CSRF protection where applicable, rate limiting and account lockout/backoff.
- Audit security events such as login success, failed login and password reset.

11. Dashboard Overview Metrics

Metric	Meaning
Visitors	Unique anonymous visitors
Page views	Total page-view events
Sessions	Visit sessions
New visitors	Visitors without a previous known anonymous ID
Returning visitors	Anonymous visitors seen previously

Metric	Meaning
CV downloads	Resume download events
Project views	Project detail views
Contact messages	Submitted contact forms
Hire Me clicks	Clicks on hiring CTA
Conversion rate	Configurable visitor-to-action percentage

12. Visitor Tracking

Use privacy-conscious anonymous analytics. Generate an anonymous visitor/session identifier rather than collecting names, passwords, private messages or invasive fingerprinting.

- Page view event with route, timestamp, session ID and anonymous visitor ID.
- Session start/end or timeout-based session duration.
- Device class: mobile/tablet/desktop.
- Browser/OS summary only when necessary.
- Referrer/source summary.
- Approximate geographic data only when legally justified and configured.
- Respect applicable privacy and cookie/consent requirements.

13. Scroll and Interaction Analytics

Track useful portfolio interactions rather than recording every mouse movement.

Event	Example
scroll_depth	25%, 50%, 75%, 90%, 100%
project_view	Cyberloop opened
project_live_click	Live Demo clicked
github_click	GitHub clicked
linkedin_click	LinkedIn clicked
hire_click	Hire Me CTA clicked
resume_download	CV downloaded
contact_submit	Contact form submitted
nav_click	Projects navigation clicked

14. Visitor Journey

The dashboard can reconstruct an anonymous session as a sequence of events, for example: Home → About → Projects → Cyberloop → Experience → CV download. Store event timestamps and route names; avoid collecting unnecessary personal data.

This allows useful questions such as: Which project is associated with the most CV downloads? Where do visitors leave? Which page leads to the Hire Me action?

15. Resume Management

- Upload or replace the current CV from the dashboard.
- Set one CV as the active public resume.
- Public CV button downloads the active file.
- Track download count and timestamp.
- Show recent anonymous download events in the dashboard.
- Optional email notification for every CV download, with a rate limit/digest option to avoid notification spam.

16. Contact / Message System

Feature	Behavior
Contact form	Name, email, message and optional subject
Validation	Client + server validation
Spam protection	Rate limit and CAPTCHA/Turnstile if needed
Inbox	New, Read, Replied, Archived
Notification	In-dashboard notification; optional email
Reply	Open the message and use the configured email workflow

17. Notification Center

- New contact message.
- New resume download.
- New important portfolio event if configured.
- Unread count in dashboard header.
- Mark read / mark all read.
- Notification preferences in Settings.
- Optional email notification channel.

18. Mobile Dashboard / PWA

The first mobile version should be a responsive PWA instead of a separate native Android/iOS application. It can be installed on the phone and behave like an app. Native packaging can be added later if a store app becomes necessary.

- Responsive dashboard cards.

- Bottom or compact mobile navigation.
- Installable PWA manifest and icons.
- Service worker for appropriate shell/offline behavior.
- Touch-friendly controls.
- Secure authenticated session.
- Push notifications can be added later where platform support and permissions justify them.

19. Suggested Technology Stack

Layer	Recommendation
Frontend	Next.js + React + TypeScript
Styling	Tailwind CSS
Animation	Framer Motion + GSAP where advanced timeline control is needed
Smooth scrolling	Lenis if required
Icons	Lucide React
Backend	Next.js server routes/actions or dedicated Node.js API
Database	PostgreSQL
ORM	Prisma
Authentication	Better Auth/Auth.js + WebAuthn/Passkeys
Charts	Recharts
File storage	Object storage such as Cloudinary/S3-compatible storage
Deployment	Vercel
Database hosting	Neon or equivalent PostgreSQL provider
Email	Transactional email provider
PWA	Web App Manifest + Service Worker

20. Suggested Data Model

Core entities should be separated so the dashboard can update the public site without redeployment.

Entity	Key fields
User	id, email, passwordHash, role, createdAt
Passkey	id, userId, credentialId, publicKey, counter, deviceType
Project	id, title, slug, description, content, featured, published, order
ProjectImage	id, projectId, url, alt, order
Experience	id, company, role, dates, description, order, visible
Education	id, institution, degree, field, dates, order, visible
Skill	id, name, category, level, value, icon, order, visible
Resume	id, fileUrl, version, active, uploadedAt
Visitor	id, anonymousId, firstSeenAt, lastSeenAt
Session	id, visitorId, startedAt, lastSeenAt, deviceType
AnalyticsEvent	id, sessionId, visitorId, type, route, metadata, createdAt
ContactMessage	id, name, email, subject, message, status, createdAt
Notification	id, type, title, body, readAt, createdAt
SiteSettings	id, profile data, social links, availability, sound settings

21. Analytics Event Architecture

A simple event pipeline is sufficient for a personal portfolio.

Browser → lightweight tracking function → secure API endpoint → validation/rate limit → PostgreSQL → dashboard aggregation

Do not send arbitrary sensitive data from the browser. Whitelist event types and metadata fields on the server.

22. Security Requirements

- Hash PIN/passwords using a modern password hashing algorithm; never store plaintext credentials.
- Use passkeys/WebAuthn for biometric/device authentication.
- Rate-limit login, reset and analytics endpoints.
- Use secure, HttpOnly, SameSite cookies for sessions.
- Validate every dashboard mutation server-side.
- Authorize every CMS operation against the authenticated admin account.
- Protect upload endpoints and restrict file types/sizes.
- Keep private dashboard routes server-protected.
- Use environment variables for secrets.
- Back up the database and implement basic audit logging.
- Do not use invasive fingerprinting or secretly record individual visitors.

23. Folder / Route Architecture

```
app/ ├── page.tsx ├── about/page.tsx ├── projects/page.tsx ├── projects/[slug]/page.tsx ├── stack/page.tsx ├──  
experience/page.tsx ├── hire/page.tsx ├── dashboard/ ├── login/page.tsx ├── page.tsx ├── visitors/page.tsx ├──  
analytics/page.tsx ├── projects/page.tsx ├── experience/page.tsx ├── skills/page.tsx ├── education/page.tsx ├──  
resume/page.tsx ├── messages/page.tsx ├── notifications/page.tsx ├── settings/page.tsx ├── api/ ├──

```

24. Development Roadmap

Phase	Work	Output
1	Project setup, database, authentication foundation	Working app + protected dashboard
2	Paper design system + responsive public shell	Home + navigation + page transitions
3	About, Projects, Stack, Experience, Hire pages	Complete public portfolio
4	Dashboard CMS	Projects/skills/experience/education editing
5	Resume + contact workflows	Downloads, inbox, notifications
6	Analytics	Visitors, sessions, page views, scroll and events
7	Live dashboard + charts	Real-time-ish anonymous active sessions and analytics
8	PWA + mobile optimization	Installable mobile dashboard
9	Security, privacy, testing	Production-ready hardening
10	Deployment + monitoring	Production release

25. Admin Workflow

Example: adding a new advanced skill

Dashboard → Stack → Add Skill → Name: GSAP → Category: Motion → Level: Advanced → Save → server validates → database updates → public /stack reads latest data → new skill appears without code changes or redeployment.

Example: updating experience

Dashboard → Experience → Edit → change role/date/description → Save → database update → public Experience page reflects the new record.

26. Analytics Dashboard Layout

Card	Example
Visitors	2,481
Page Views	8,921
CV Downloads	137
Messages	24
Live Now	3 anonymous sessions
Top Project	Cyberloop
Top Page	/projects
Scroll Completion	30% reaching 90%+

Recommended charts:

- Visitors over time.
- Page views over time.
- CV downloads over time.

- Scroll-depth funnel.
- Top pages/projects.
- Visitor-to-CV and visitor-to-contact conversion.

27. Performance Requirements

- Keep the public portfolio fast despite paper texture and animation.
- Optimize images using modern formats and responsive sizes.
- Lazy-load below-the-fold galleries.
- Respect prefers-reduced-motion.
- Avoid shipping the entire dashboard analytics code to public pages.
- Use server components where appropriate and client components only for interactive sections.
- Cache public CMS data where appropriate and invalidate after dashboard changes.

28. SEO Requirements

- Unique title and description per public page.
- Open Graph/Twitter metadata.
- Semantic headings and accessible navigation.
- Project-specific metadata and canonical URLs.
- Sitemap and robots configuration.
- Descriptive image alt text.
- Fast Core Web Vitals and mobile-friendly layout.

29. Accessibility

- Keyboard-accessible bottom navigation.
- Visible focus states.
- ARIA labels for icon-only controls.
- Hover tooltip must have an accessible name for keyboard/screen-reader users.
- Sufficient contrast.
- Reduced-motion mode.
- Do not rely on sound as the only feedback mechanism.
- Touch targets should be comfortable on mobile.

30. Final Feature Checklist

☐ Vintage paper visual system	☐ Responsive desktop/mobile portfolio
☐ Bottom icon navigation	☐ Hover labels
☐ Separate About page	☐ Separate Projects page
☐ Separate Stack page	☐ Separate Experience/Education page
☐ Hire Me page	☐ CV download
☐ Optional navigation sound	☐ Page transitions
☐ Secure dashboard login	☐ 4-digit PIN UI
☐ Email/password fallback	☐ Forgot password
☐ WebAuthn/passkey support	☐ Dashboard overview
☐ Visitor analytics	☐ Live anonymous sessions
☐ Page analytics	☐ Scroll-depth tracking
☐ Project interaction tracking	☐ Resume download tracking
☐ Resume download notifications	☐ Contact message notifications
☐ Portfolio CMS	☐ Experience add/edit/delete
☐ Skills add/edit/delete	☐ Advanced skill level
☐ Education add/edit/delete	☐ Projects add/edit/delete
☐ Publish/unpublish	☐ Drag/reorder content
☐ Mobile dashboard/PWA	☐ Analytics charts
☐ Security hardening	☐ Privacy-conscious tracking
☐ SEO	☐ Accessibility
☐ Vercel deployment	

31. Recommended Build Order

Do not build the analytics dashboard first. Build the public portfolio and content model first, then connect tracking and the dashboard to the same data.

- 1. Database schema + CMS content types.
- 2. Public portfolio design system.
- 3. Bottom navigation + page transitions.

- 4. All public pages.
- 5. Dashboard authentication.
- 6. CMS CRUD for projects, skills, experience and education.
- 7. Resume and contact workflows.
- 8. Analytics event collection.
- 9. Dashboard analytics and notifications.
- 10. PWA, security, SEO, accessibility and production deployment.

32. Final Product Definition

The finished product is not just a portfolio website. It is a personal portfolio platform: a distinctive interactive public portfolio backed by a private CMS, analytics dashboard, resume system, contact inbox and notification center. Content such as projects, experience and skills can be changed from the dashboard and reflected on the public site without editing code.

The visual identity should remain memorable: vintage paper + archival/editorial details + modern motion + minimal bottom navigation. The private dashboard should prioritize clarity, speed, security and useful analytics.
